Quality Contr	ol Oligor	Oligonucleotide synthesis is monitored base by base through trityl analysis to ensure				
	appro	appropriate coupling efficiency. The oligo is subsequently purified by affinity-solid				
	phase	phase extraction. The annealed RNA duplex is further analyzed by mass				
	spectr	spectrometry to verify the exact composition of the duplex. Each lot is compared to				
	the pr	the previous lot by mass spectrometry to ensure maximum lot-to-lot consistency.				
Components	We of	We offers pre-designed sets of 3 different target-specific siRNA oligo duplexes of				
	huma	human IDH2 gene. Each vial contains 5 nmol of lyophilized siRNA. The duplexes can				
	be tra	be transfected individually or pooled together to achieve knockdown of the target				
	gene,	gene, which is most commonly assessed by qPCR or western blot.

Directions for Use

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250 μ l of DEPC water to get a final concentration of 20 μ M.
